
Case Study: Hospital Application Security

Challenge:
Ensure that Hospital Applications are in compliance with security regulations

Solution:
VisionIT architects and developers addressed applications and their interfaces

Results:
The hospital chain complied with all regulatory requirements

The VisionIT Difference

Our client had various legacy applications as well as new applications in development across multiple hospitals. New security regulations concerning application interfaces and security designs required these applications to be reviewed for compliance and corrective action taken when necessary.

VisionIT provided application reviews, guidance, and support. We advised our client on processes associated with HIPAA, credit card and PCI compliance, while providing advice and auditing as well as incidence response. VisionIT professionals also tracked and made sure the hospital's applications complied with security regulations. This required VisionIT to interface with corporate officers and individual departments, and projects included the migration of cottage hospital applications, ongoing migration of an acquired hospital and the opening of a new Hospital.

√ Our Client was able to comply with all regulatory and security requirements for multiple hospitals using many applications. The VisionIT professionals became trusted consultants and valued members of the hospital's IT team.

Providing the right team of architects and developers skilled in the right technologies in a timely and cost effective manner resulted in a major success for our client.
